

INCIDENT REPORT

INC-2026-001

Automated Detection & Triage of Malicious Payload (Pipeline Validation)

STATUS: ● CLOSED

1. INCIDENT OVERVIEW

Ticket ID	INC-2026-001
Title	Automated Detection & Triage of Malicious Payload (Pipeline Validation)
Analyst	Jacek Kaplon
Severity	HIGH
Detection Source	Wazuh Manager — Rule 87105 (VirusTotal Alert)
Detection Time	2026-06-16 21:54:21 UTC
Sensor Node	rpilab (agent.id: 017) 192.168.1.11
Classification	TRUE POSITIVE — Simulated Threat Intelligence Pipeline Validation

2. TRIAGE & CLASSIFICATION

Alert Type	Malware Payload Ingestion via File Integrity Monitoring (FIM)
File Path	/var/lib/docker/volumes/<volume_id>/_data/lib/cowrie/downloads/test_eicar.txt
SHA-256 Hash	275a021bbfb6489e54d471899f7db9d1663fc695ec2fe2a2c4538aabf651fd0f
VT Verdict	MALICIOUS — 60 / 72 detection engines confirmed
VT Permalink	https://www.virustotal.com/gui/file/275a021bbfb6489e54d471899f7db9d1663fc695ec2fe2a2c4538aabf651fd0f
Rule Fired	87105 (severity: 12) groups: virustotal
MITRE Tactic	Execution
MITRE Technique	T1203 — Exploitation for Client Execution
PCI DSS	10.6.1, 11.4

3. INVESTIGATION & ROOT CAUSE

Attack Vector: Simulated file upload to honeypot persistent storage volume.

System Response Sequence:

- Wazuh Agent FIM engine (inotify) detected filesystem write event → **Rule 554** fired (File added to system)
- Wazuh Manager computed SHA-256 hash of dropped payload and initiated automated outbound REST API call to VirusTotal
- VirusTotal integration returned positive match → **Rule 87105** fired with severity 12
- Full enrichment cycle completed in **<5 seconds** from file write to SIEM alert

End-to-End Pipeline Validation:

File drop → FIM inotify trigger → SHA-256 hash → VirusTotal API → Alert enrichment → SIEM dashboard
Rule 554 (FIM) → Rule 87105 (VT malicious) | Latency: <5s

4. CONTAINMENT & REMEDIATION

Containment	Honeypot isolation is inherent to the lab architecture — no production resources impacted
Action Taken	File quarantined; log events exported for forensic analysis
Recommended Action	Monitor host-level activity for anomalous outbound connections from the honeypot node; implement Active Response module for automated source IP null-routing

5. ANALYST COMMENTS & LESSONS LEARNED

The validation of the automated detection pipeline was successful. The end-to-end flow from file ingestion on the honeypot sensor to external threat intelligence enrichment was completed in under 5 seconds, confirming the efficacy of the current SIEM/XDR configuration for rapid incident triage.

Key findings:

- FIM real-time monitoring (inotify) correctly detected file write with zero manual intervention
- VirusTotal API integration returned 60/72 engine verdict — pipeline enrichment validated
- MITRE ATT&CK mapping (T1203) correctly attributed by automated rule correlation
- Alert-to-enrichment latency: <5 seconds — acceptable for L1 SOC triage workflow

Next Step: Integration of Wazuh Active Response module to automate dynamic null-routing of source IPs confirmed malicious by VirusTotal lookup threshold — transitioning from passive detection to active automated containment.
